

Cooling the earth with cereals

- global agriculture major part in man-made climate change, partly due to different sunlight reflectivity of crop plants

Cooling the earth with cereals

- global agriculture major part in man-made climate change, partly due to different sunlight reflectivity of crop plants
- existing cropland areas usable to mitigate global warming?

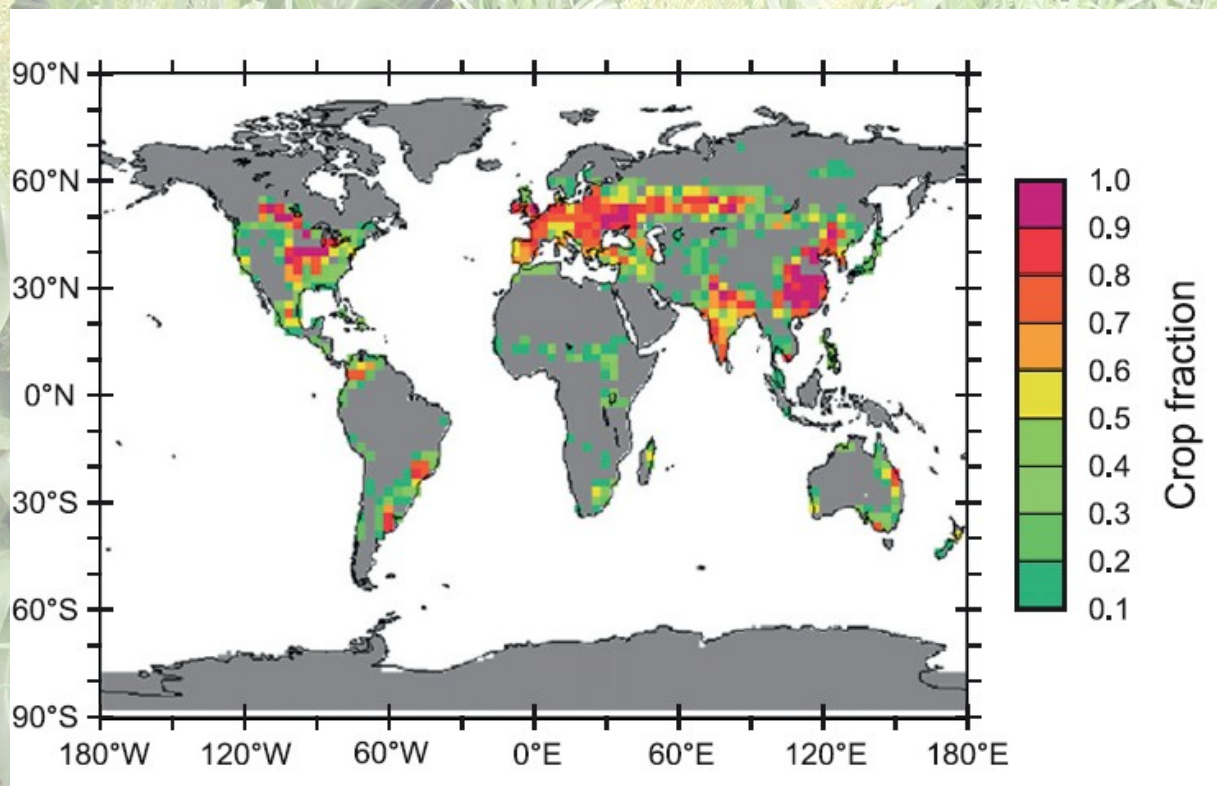

Cooling the earth with cereals

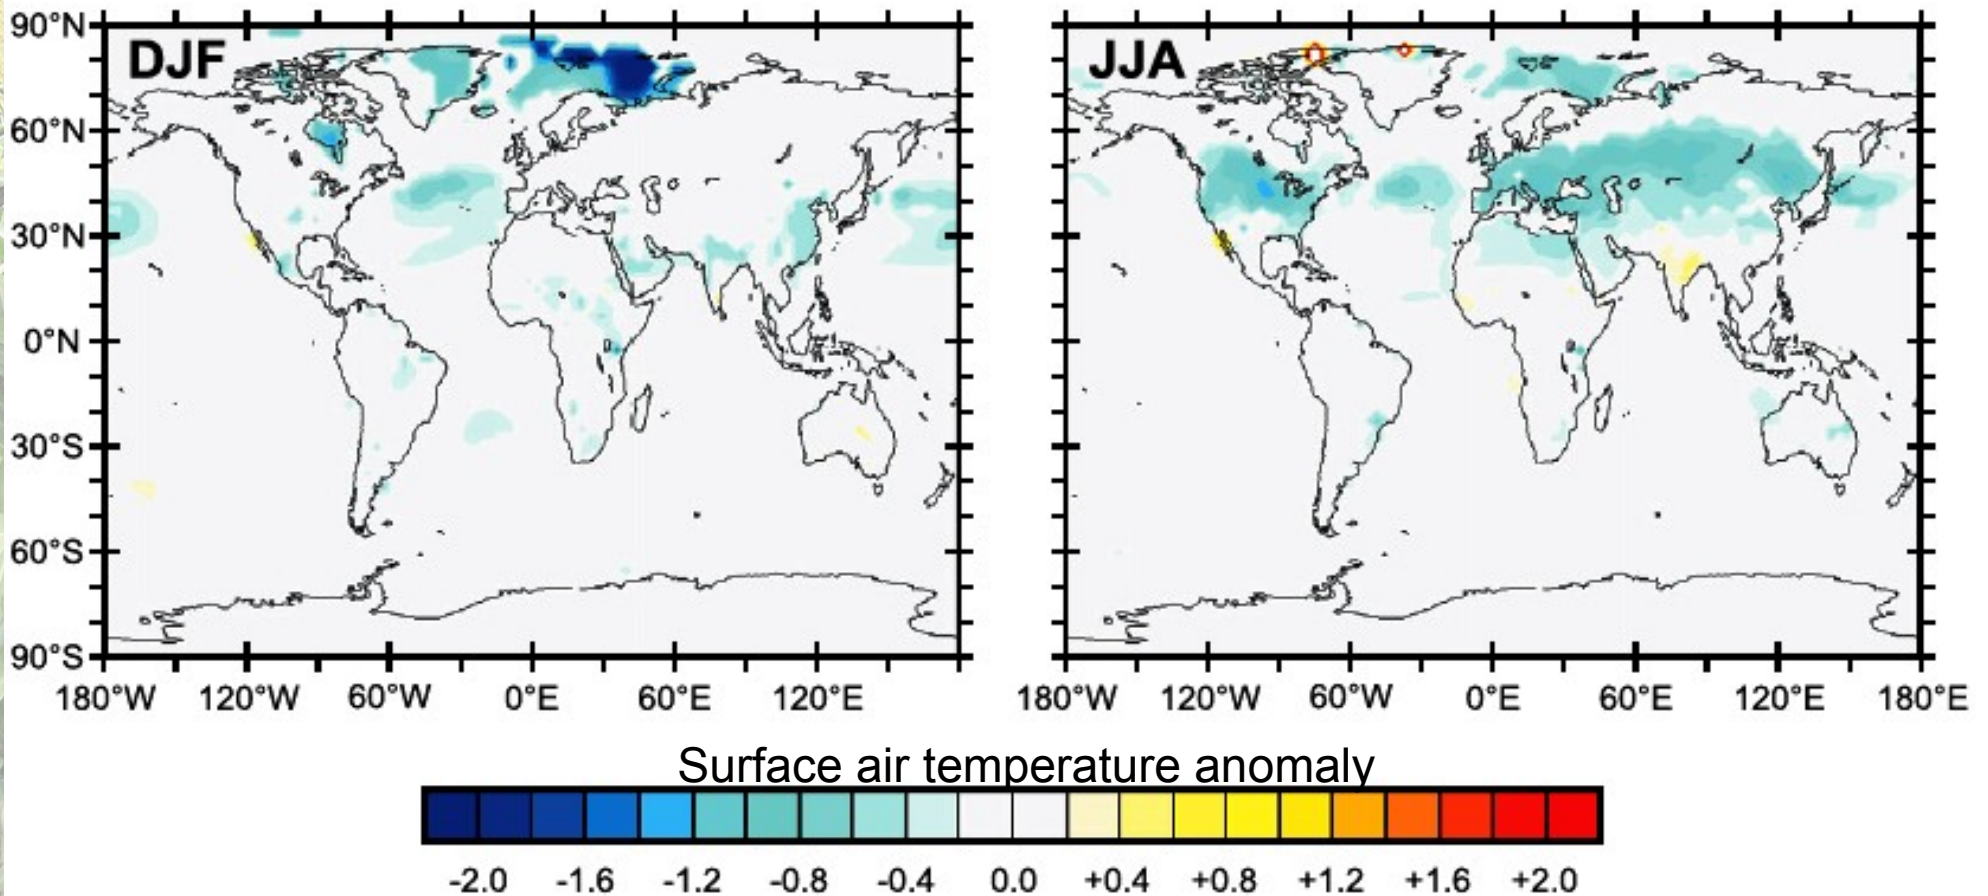

- global agriculture major part in man-made climate change, partly due to different sunlight reflectivity of crop plants
- existing cropland areas usable to mitigate global warming?
- climate model simulation focusing on crop plant albedo:
Ridgwell et al., Tackling Regional Climate Change By Leaf Albedo Bio-geoengineering, Current Biology (2009)

Cooling the earth with cereals

- climate model simulation focusing on crop plant albedo:
Ridgwell et al., Tackling Regional Climate Change By Leaf Albedo Bio-geoengineering, Current Biology (2009)

- increasing cropland canopy albedo α by 20 % may reduce summertime surface temperature by $> 1^\circ\text{C}$ in North America/Eurasia in next 200 years

- increasing cropland canopy albedo α by 20 % may reduce summertime surface temperature by $> 1^\circ \text{C}$ in North America/Eurasia in next 200 years
- global temperature reduction: $(0.111 \pm 0.091)^\circ \text{C}$ (!)

- increasing cropland canopy albedo α by 20 % may reduce summertime surface temperature by $> 1^\circ \text{C}$ in North America/Eurasia in next 200 years
- global temperature reduction: $(0.111 \pm 0.091)^\circ \text{C}$ (!)
- suggestion: use high- α crop plant varieties, possibly by gene modification
